- What is GPR?
- How does GPR work?
- Various Applications
- Signal Interpretation
- Example of GPR Radargrams

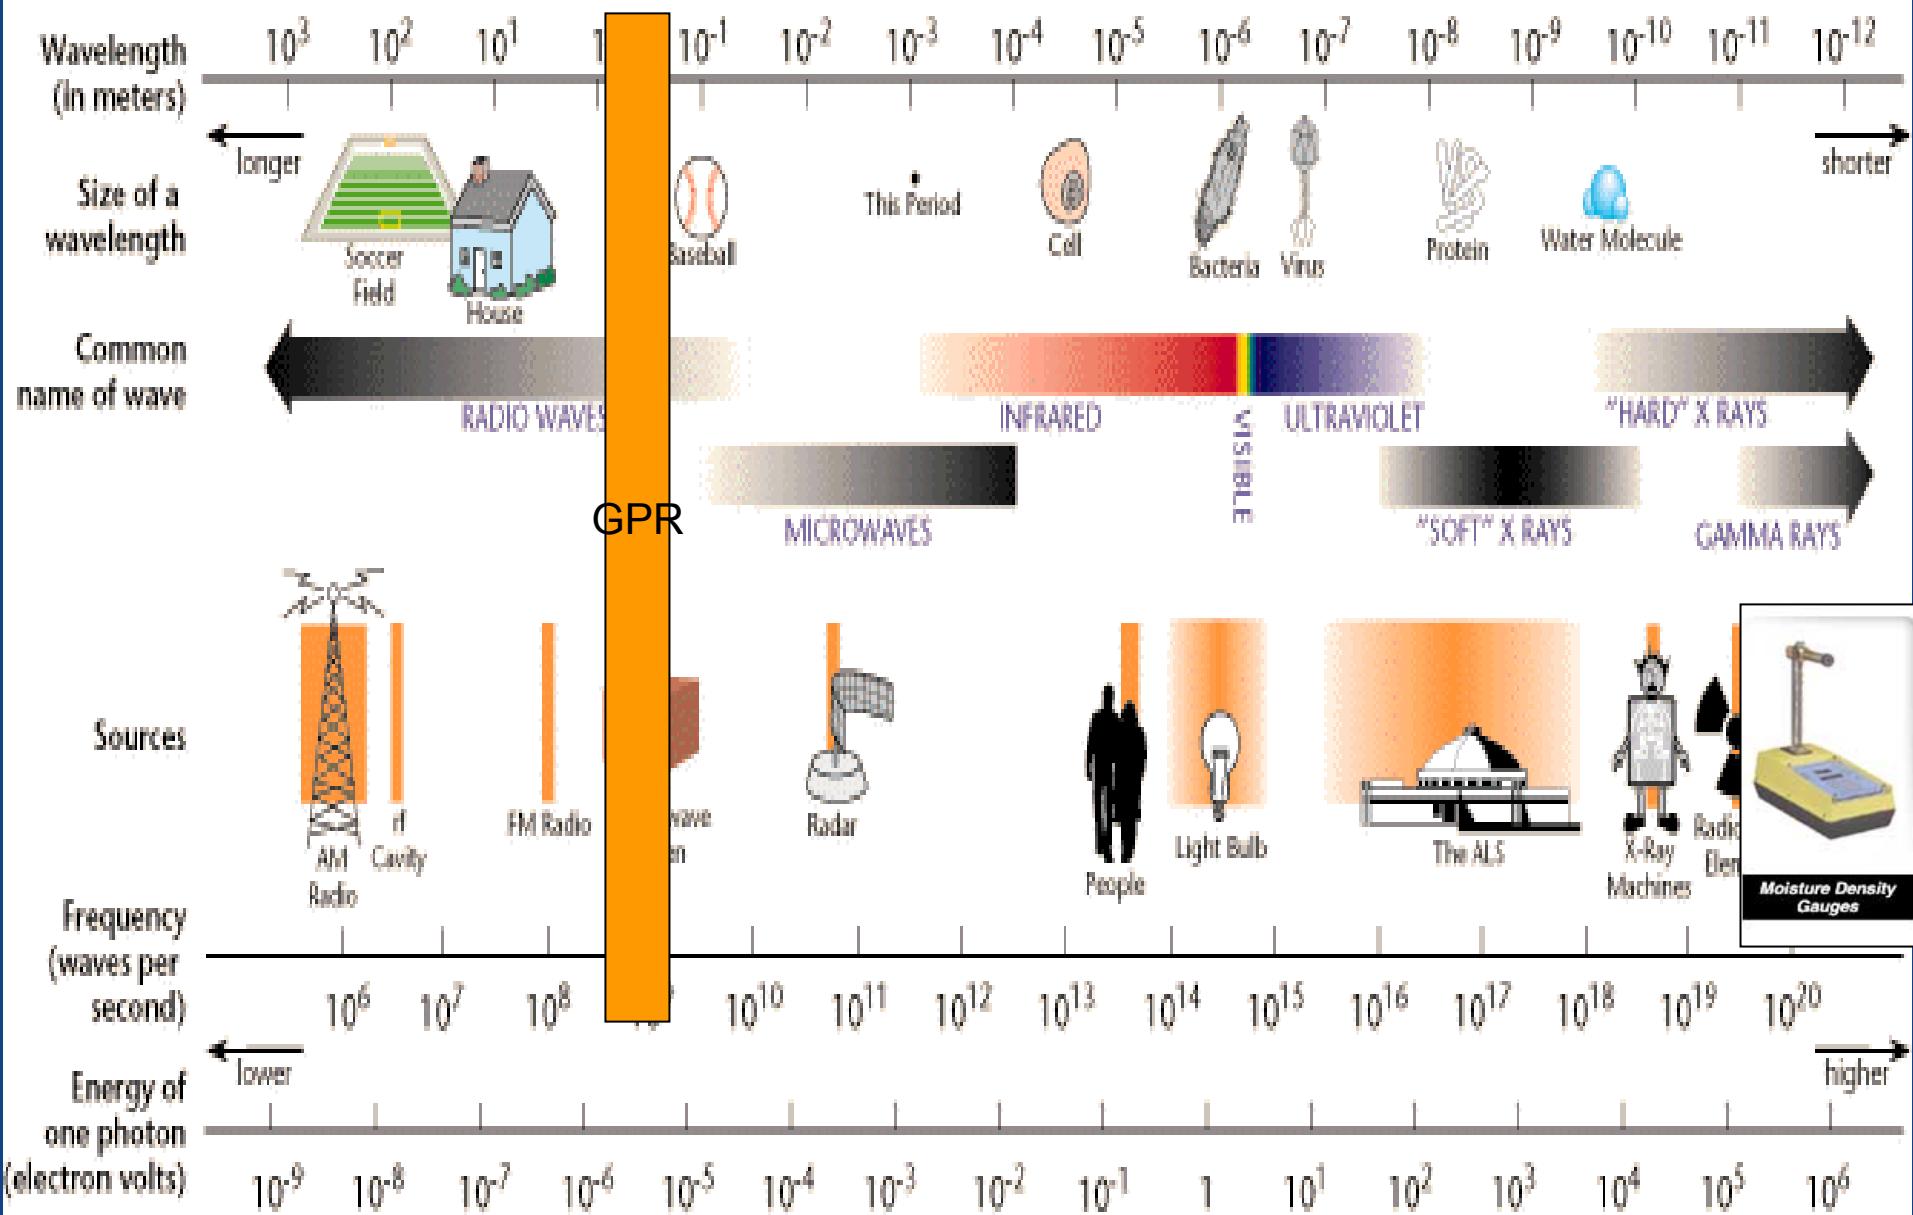

# What Is Ground Penetrating Radar?

- GPR is a geophysical technique that radiates **electromagnetic energy** into the subsurface. When this pulse strikes an interface between layers of materials with different electrical properties, part of the wave reflects back, and the remaining energy continues to next interface.

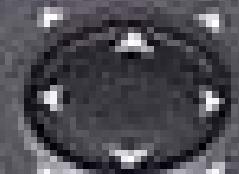

# THE ELECTROMAGNETIC SPECTRUM

# *How does GPR Work?*

**LOWRANCE**

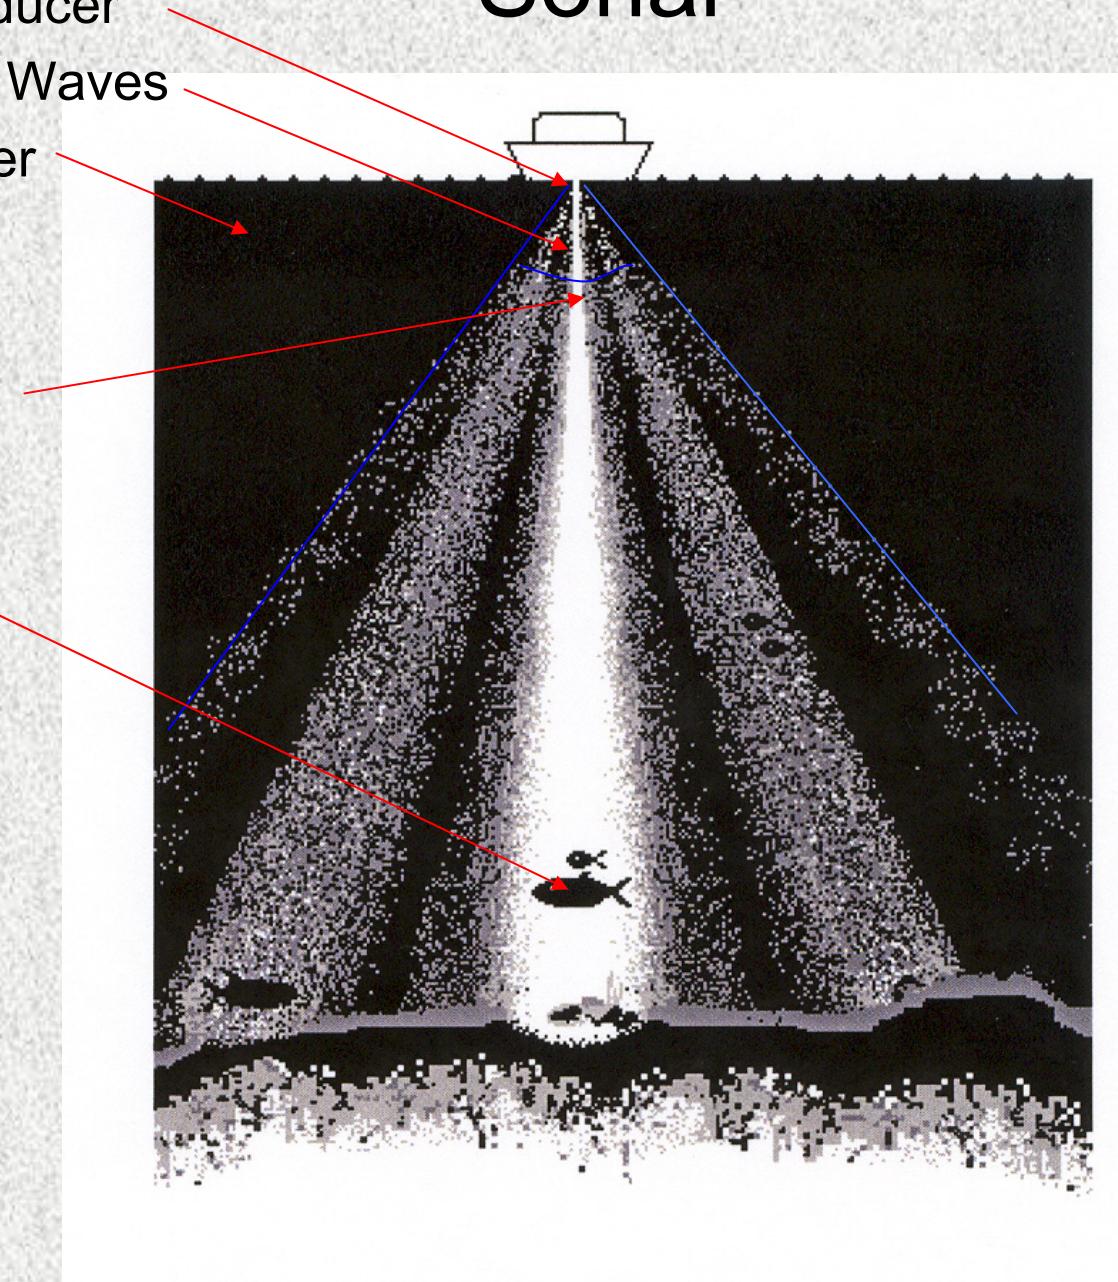

**X-15C**

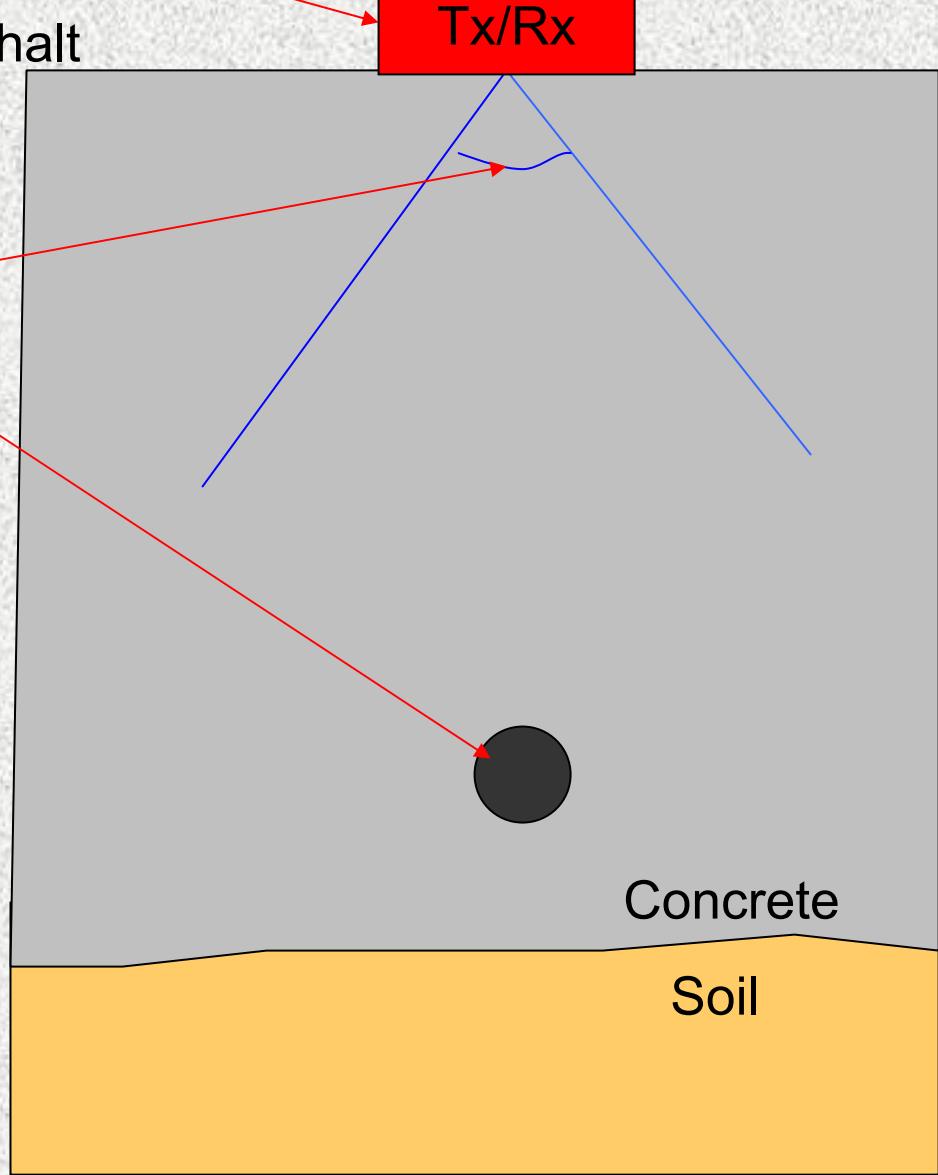

# Sonar

- Energy Generation – Transducer
- Energy Source – Ultrasonic Waves
- Propagation Medium – Water
- Wave Speed - ~1500 m/s
- Frequency ~ 400 kHz
- Cone Angle ~ 10 degrees
- Target - fish

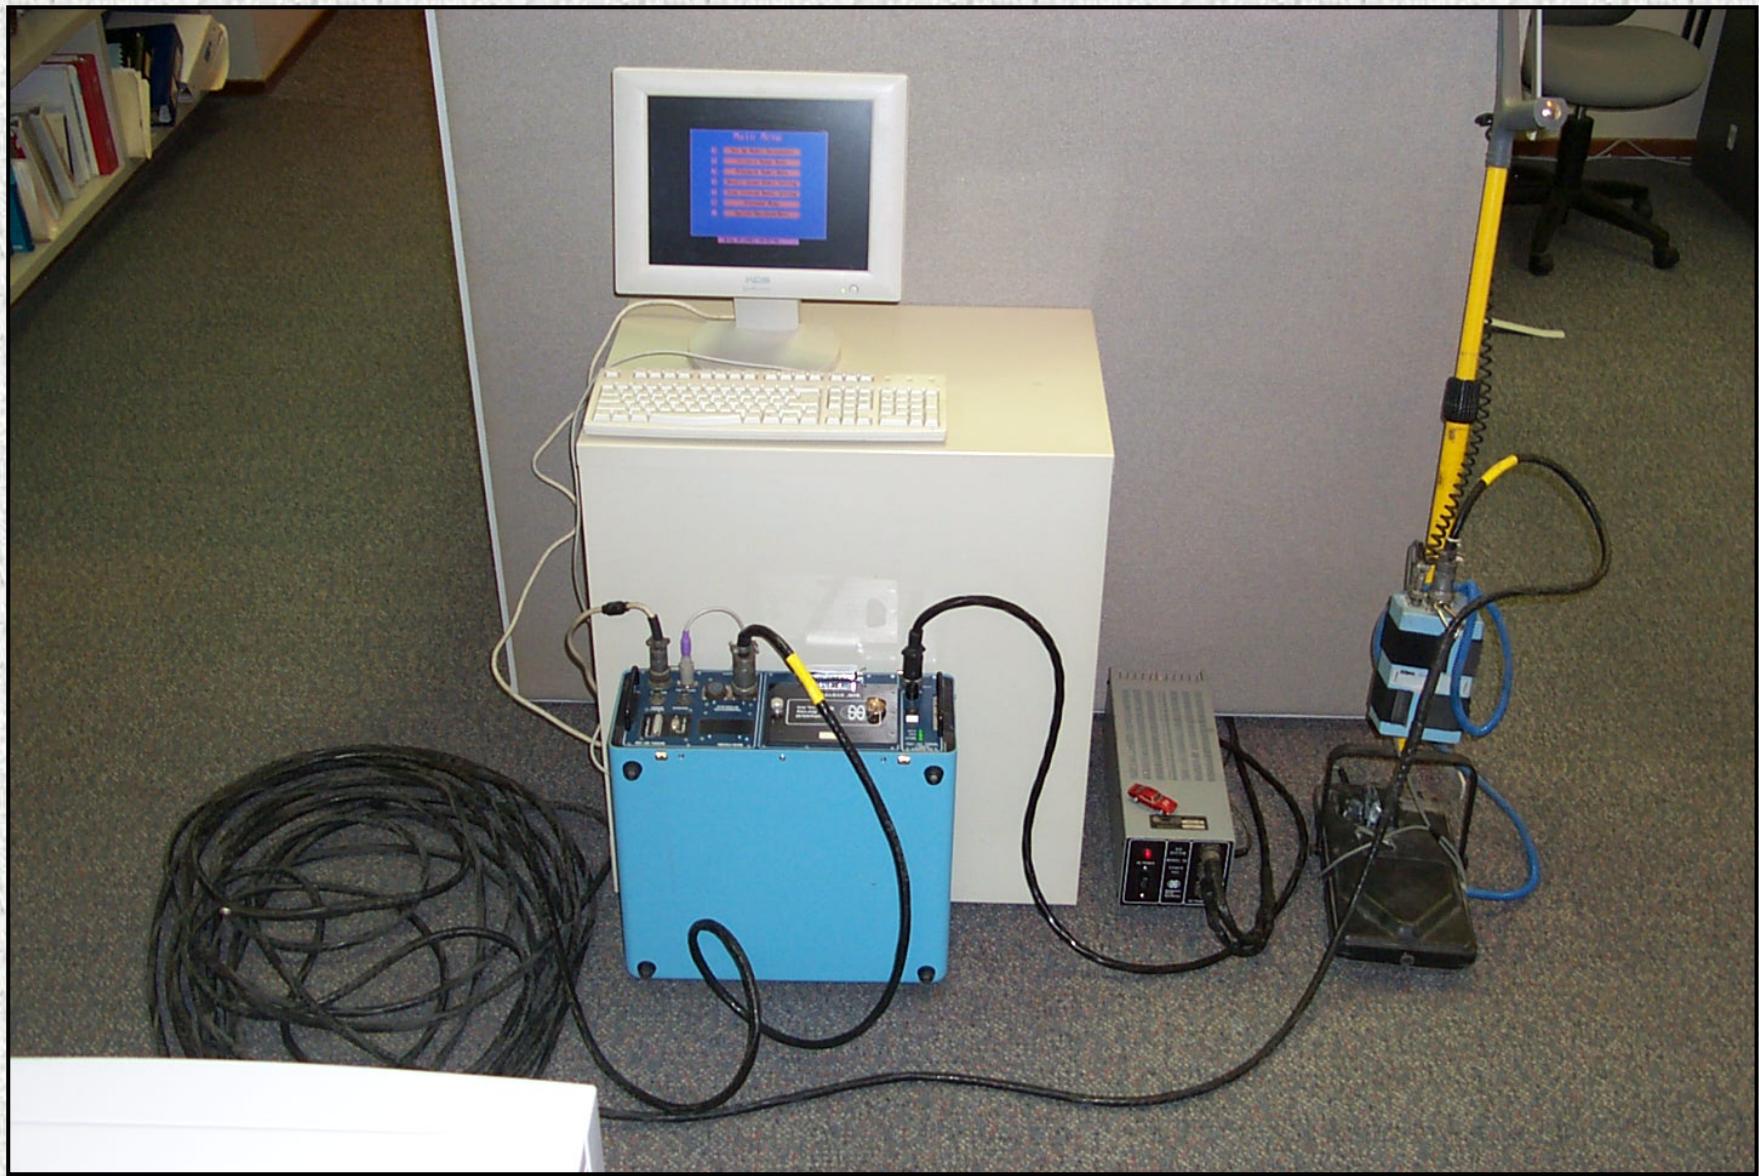

# GPR

- Energy Generation – Antennae
- Energy Source – Electromagnetic
- Propagation Medium – Concrete/Asphalt
- Wave Speed -  $\sim 100000000$  m/s
- Frequency  $\sim 1000$  to 1500 MHz
- Cone Angle  $\sim 60$  to 90 degrees
- Target – pipe, rebar, voids, etc.

# EQUIPMENT

# *Various Applications of GPR*

## *For Structure Evaluation*

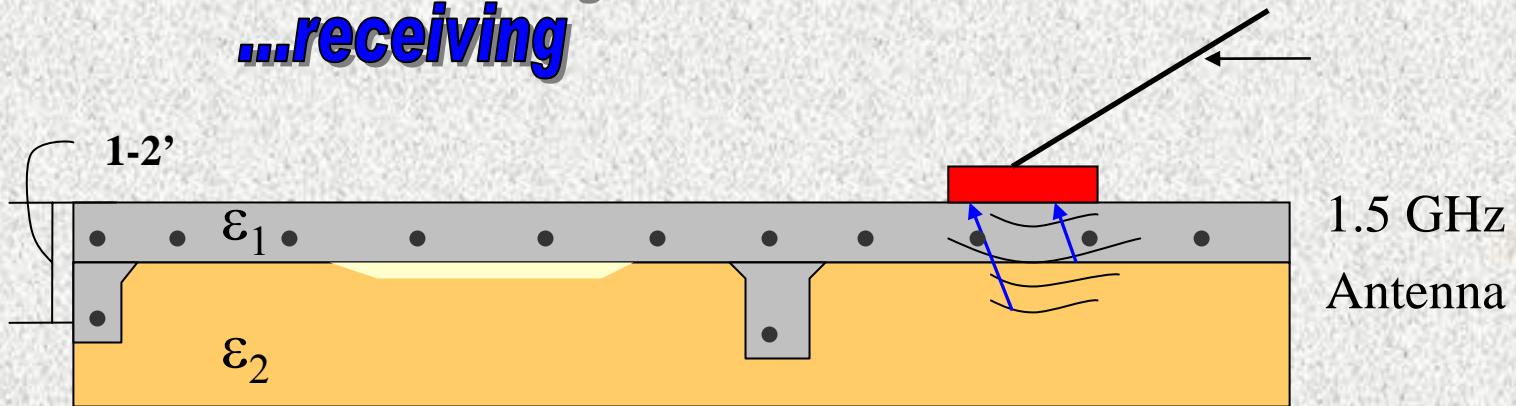

# TYPE OF STRUCTURE

TUNNELS  
PARKING LOTS  
RETAINING WALLS  
STREETS/HIGHWAYS  
TILT WALL PANELS  
FOUNDATION SLABS

# GROUND PENETRATING RADAR

*transmitting...  
...receiving*

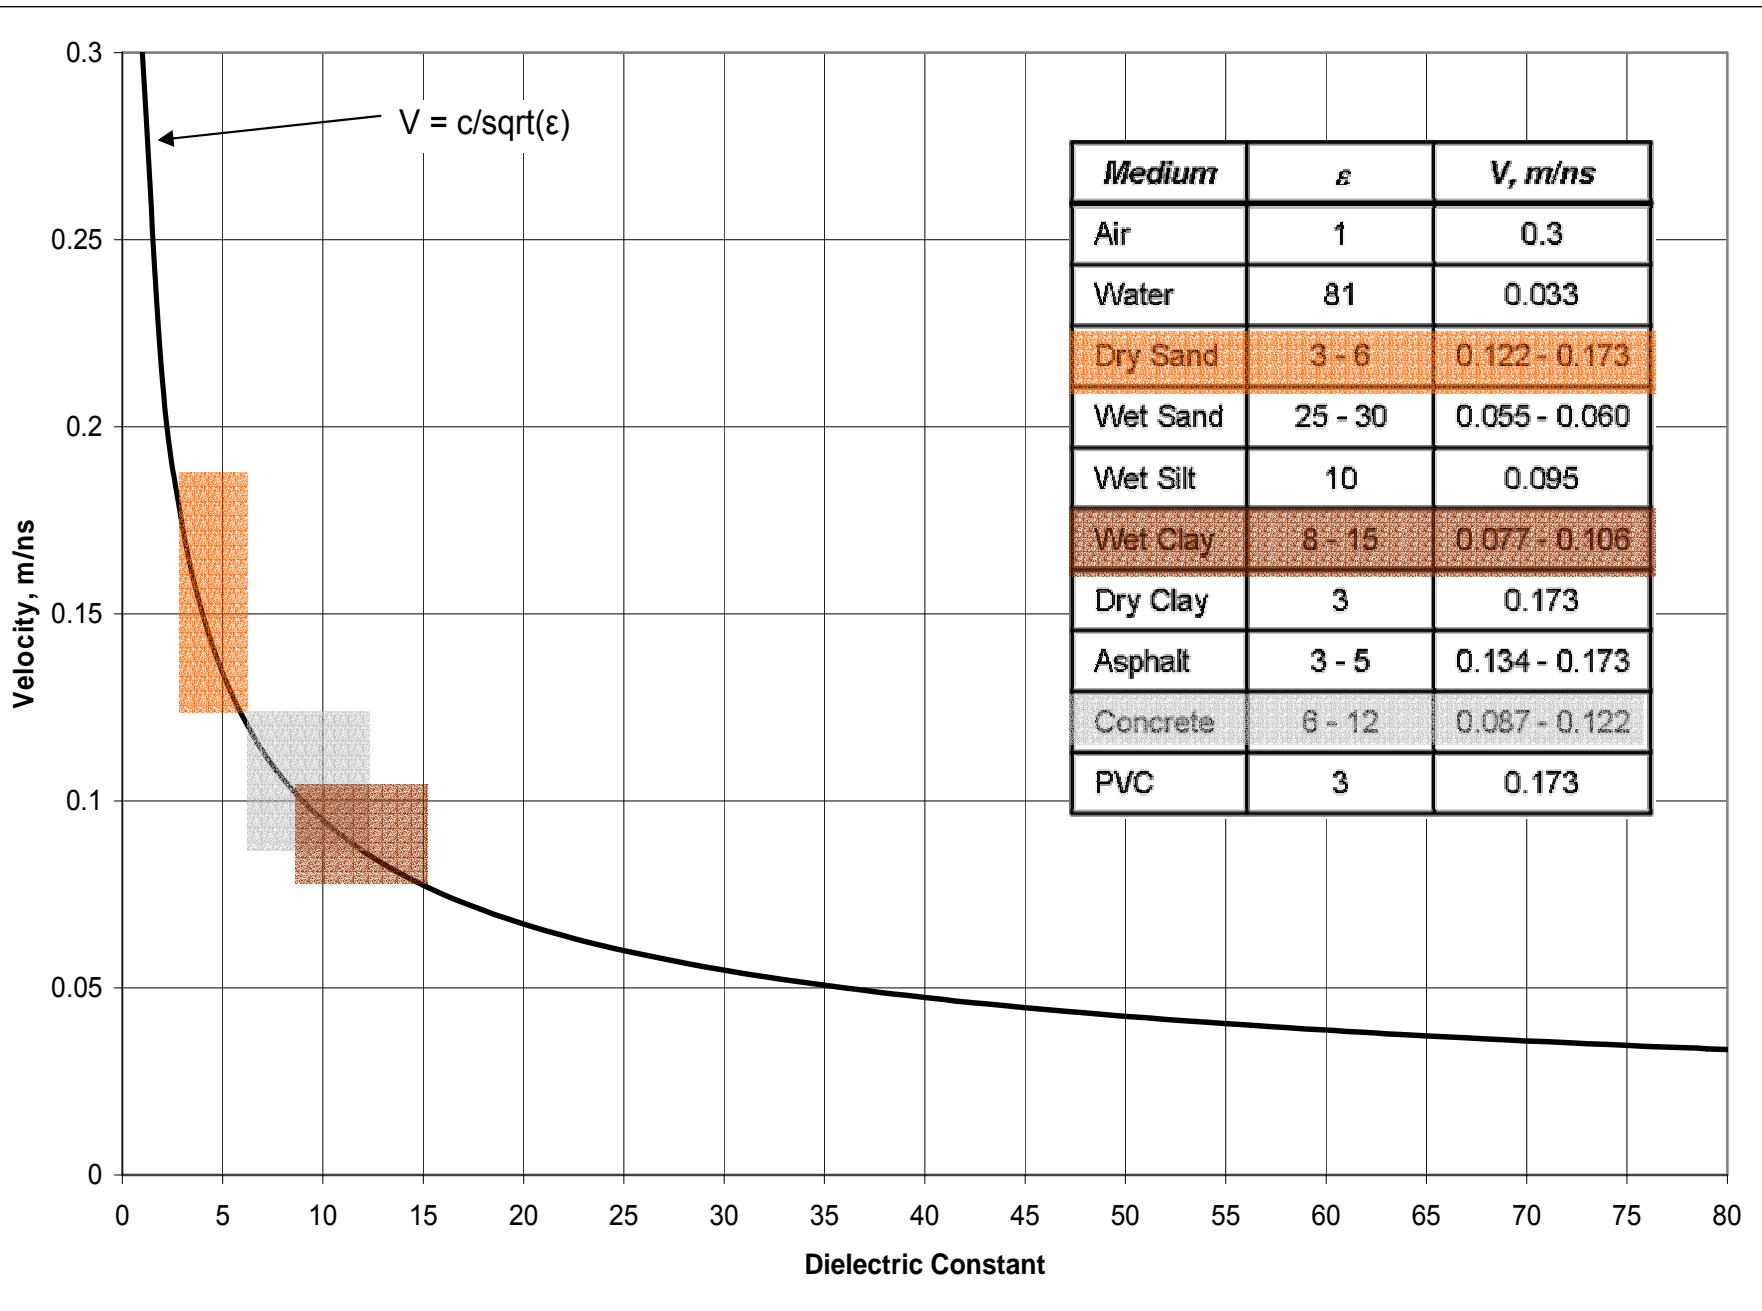

*Useful for detecting/quantifying:*

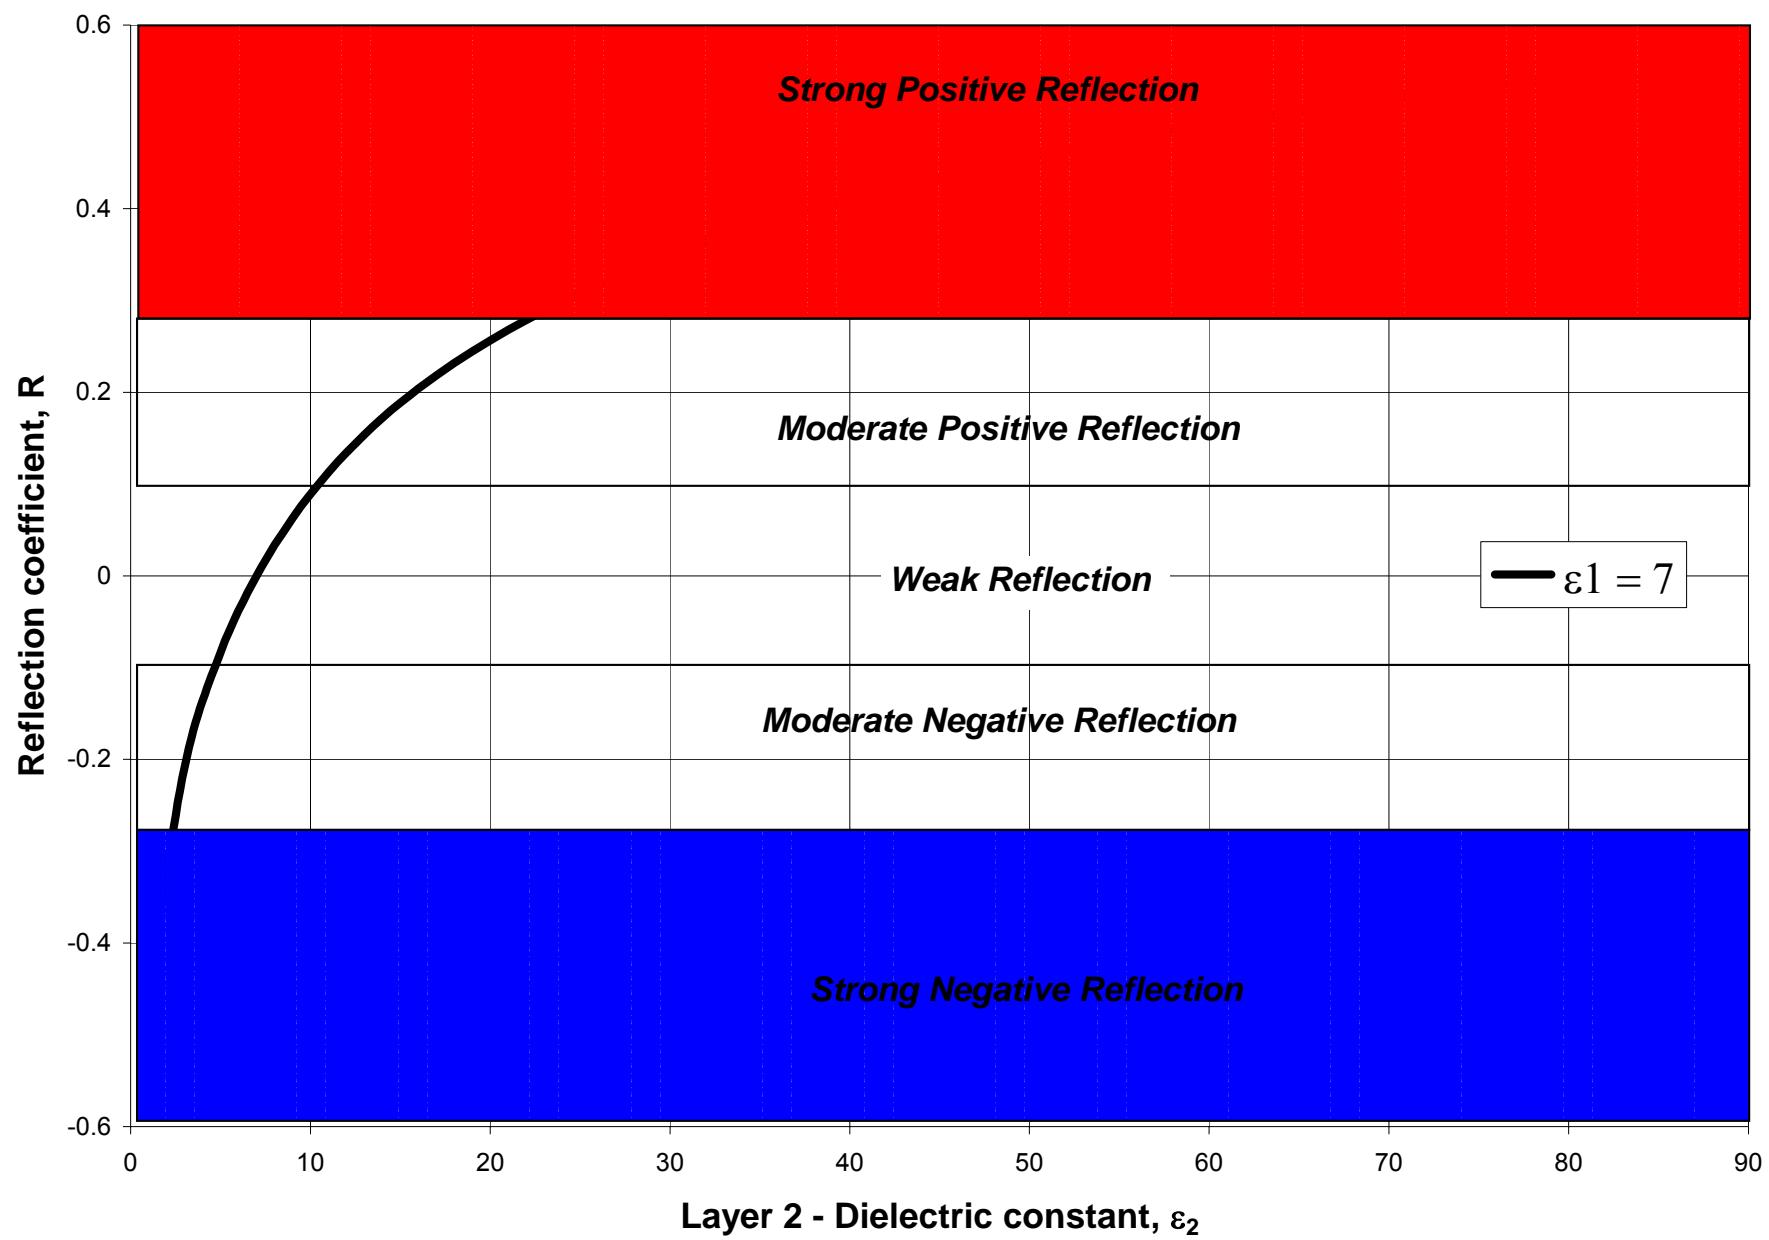

- Pavement/slab thickness
- Grade beam location/depth
- Reinforcement placement (vertical/horizontal)
- Subsurface Void detection (water/air filled)
- Utility lines

- **HIGH RESOLUTION**
- **LIMITED DEPTH**

# *Signal Interpretation*

Calcs

$$\frac{JE_2 - JE_1}{\sqrt{E_2} + \sqrt{E_1}}$$

$$= -0.52$$

$$0.58$$

$$0.1$$

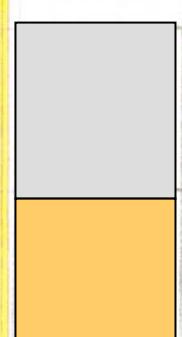

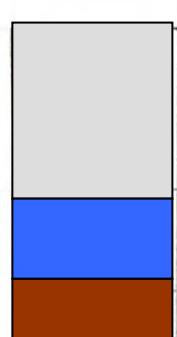

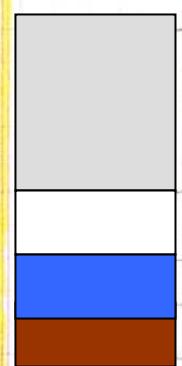

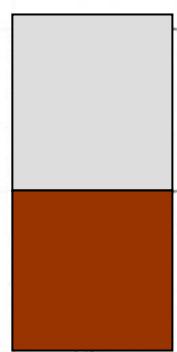

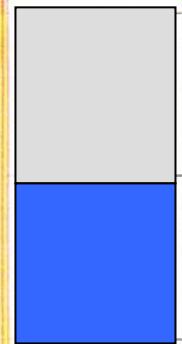

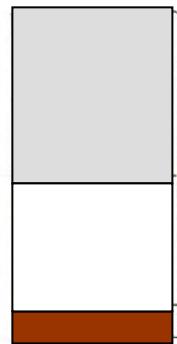

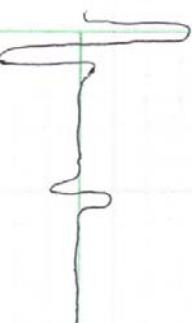

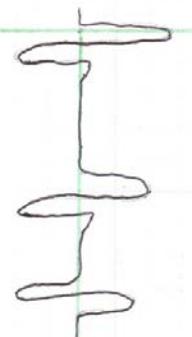

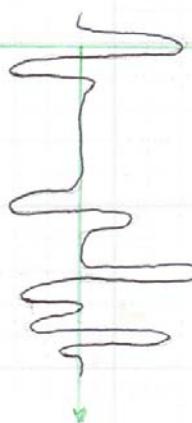

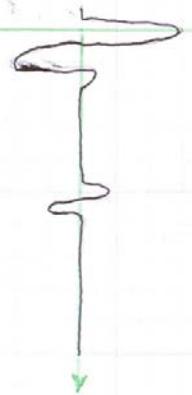

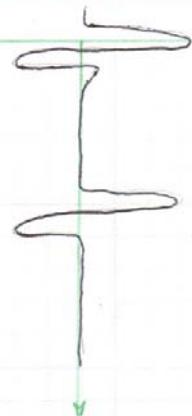

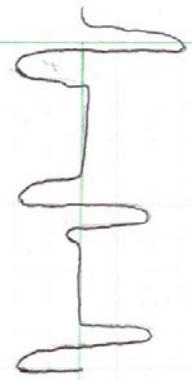

$$0.48$$

$$-0.40$$
